

Vulnerability Scanning and Spyware Detection

Stay a step ahead of attackers by identifying vulnerabilities in your software and operating systems before they are exploited. Webroot is the only Web Security Service to include this powerful, extra layer of protection.

Vulnerability Scanner

Today's web-based malware is commonly spread by exploiting known software and operating system vulnerabilities. Webroot Web Security Service helps you reduce risk by identifying these vulnerabilities before an attacker does. Scan endpoints directly from the Desktop Web Proxy (DWP) to identify known vulnerabilities including operating systems, browser versions, media players, office programs, and other installed software. In less than 15 seconds, the Webroot service can run more than 400 tests, and you can immediately view searchable test results that identify the risk severity.

Select Products For Custom Scan :

■ Scan ■ No Scan ■ Mixed Selection

Products For Scan	Selection
▶ Browsers	Scan
▶ Operating System	Scan
▶ Browser Plugins	Scan
▶ Third Party	Scan
▶ Office	Scan
▶ Media Players	Scan
▶ Instant Messengers	Scan
▶ Microsoft Components	Scan

Scan all products for vulnerabilities, or run a custom scan by selecting specific components.

Spyware Detection

Quickly detect more than 3500 types of common spyware infections that could put your corporate data at risk, such as malicious Trojans and keyloggers. In addition to monitoring outbound traffic from a system, Webroot now automatically analyzes the processes running on the user's computer. Spyware detection is integrated into the vulnerability scanner, so you'll receive a detailed spyware and vulnerability assessment for each machine tested.

BENEFITS

- ✓ Mitigate risk with an in-depth defense strategy that rapidly detects weaknesses in your endpoint security
- ✓ Easily identify hundreds of software, operating system, and browser vulnerabilities
- ✓ Prevent data breaches by detecting over 3500 types of Trojans, keyloggers, and other malicious spyware infections
- ✓ Aggressively monitor your IT infrastructure without hindering user productivity
- ✓ Facilitate quick remediation with weekly, monthly, or ad-hoc scans that deliver results in under 15 seconds
- ✓ Save resources by eliminating the need to purchase and manage separate vulnerability scanners

Run more than 400 vulnerability tests on:

- ✓ Browsers
- ✓ Operating systems
- ✓ Browser plug-ins
- ✓ Third-party applications
- ✓ Office programs
- ✓ Media players
- ✓ Instant messengers
- ✓ Microsoft components

Simplified Management

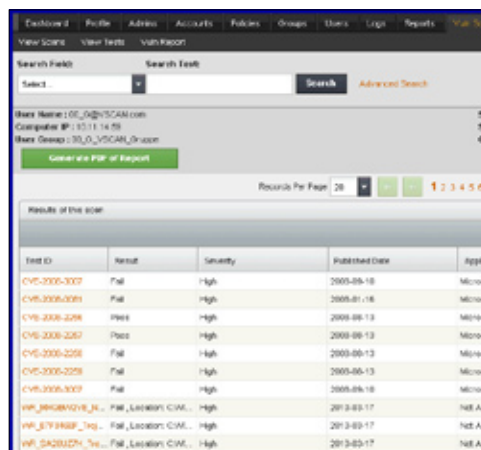

With scans configured directly from the Policies tab of the Web Security Service Management Portal, the Webroot scanner saves you the time and hassle of managing a separate vulnerability scanner. Schedule weekly or monthly scans, or run immediate scans at any time. View results on the new Scan Results tab in the Management Portal. You can search and sort by machine, user, type of scan and number of vulnerabilities, then drill down to view information about each machine or threat.

Fast Performance

The scanner's installer is only 1.7 MB, keeping the DWP lightweight yet powerful. Scans take less than 15 seconds to run, with a complete analysis performed in the cloud. The scanner focuses on the programs most susceptible to malicious attacks, providing an extra layer of endpoint defense without impacting machine performance or hindering user productivity. Process information is uploaded to the cloud, where Webroot identifies vulnerabilities and centralizes results in a Web-based management portal.

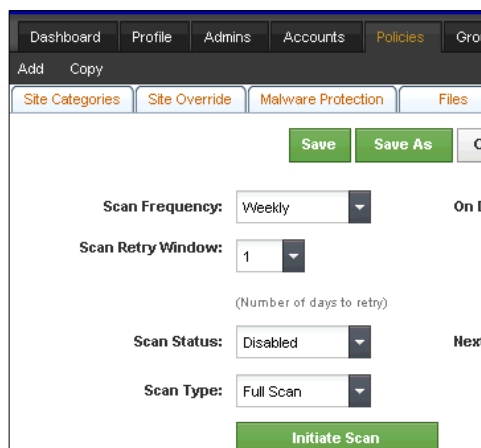

About Webroot Web Security Service

Webroot Web Security Service provides better protection by blocking malware threats before they ever reach your network. Mobile employees receive the same high level of security they would back at the office. You can easily enforce Internet use policies, track web trends, and secure your network against viruses, spyware, phishing and data loss. And with no hardware or software to manage, your IT team saves time and money.

Test ID	Result	Severity	Published Date	Action
CVE-2009-3007	Fail	High	2009-06-18	Micro
CVE-2009-3001	Fail	High	2009-01-16	Micro
